Step by Step Coding

All Code in Git

expandtabs(), isalpha(),
format_map() isascii()

- Python String Methods
  - isdecimal()
  - isdigit()
  - isnumeric()

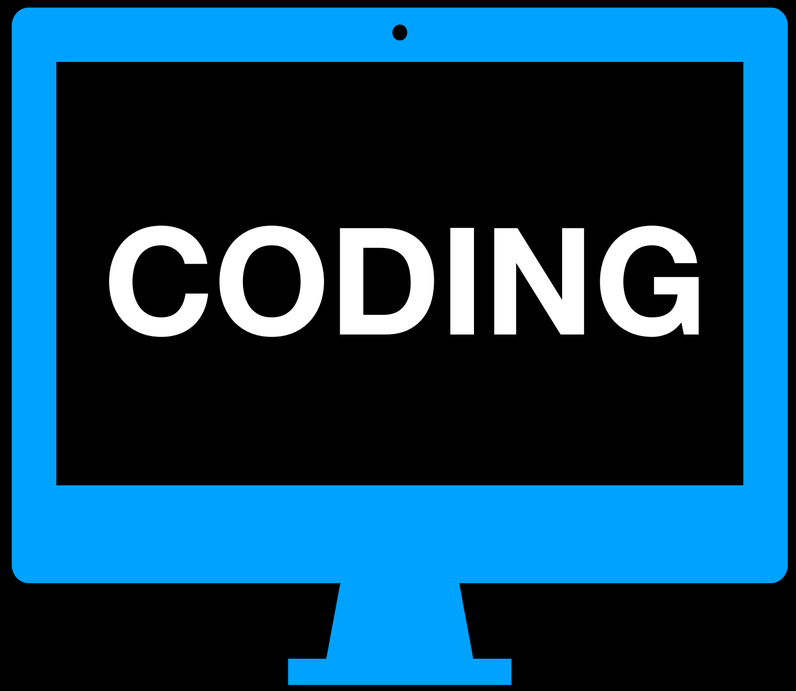
Python String Methods

isdecimal()

The isdecimal() method returns True if the string is nonempty and all characters are decimals (0-9) including unicode characters. Otherwise, it returns False.

- Output : True/False

- Python String Methods
  - isdecimal()



Python String Methods

isdigit()

The isdigit() method returns True if the string is nonempty and all characters are decimals (0-9) including unicode characters. Otherwise, it returns False.

- Output : True/False

- Python String Methods
  - isdigit()

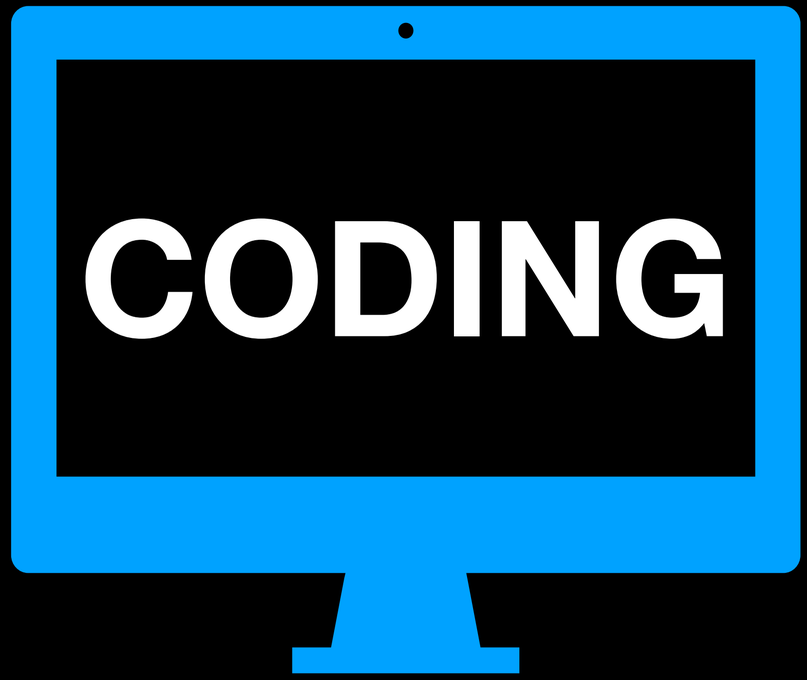
Python String Methods

isnumeric()

The isnumeric() method returns True if the string is nonempty and all characters are decimals (0-9) including unicode characters. Otherwise, it returns False.

- Output : True/False

- Python String Methods
  - isnumeric()



- Difference between isdecimal(), isdigit() & isnumeric()

	isdecimal()	isdigit()	isnumeric()
Decimal	YES	YES	YES
Subscript & Superscript	NO	YES	YES
Vulgar Fraction	NO	NO	YES

Thank You
