PYTHON
Variables

- # Python Variables

Variable is a name that is given to refer a memory location. In Python , We do not need to declare variables type before using them. It is automatically taken care by python.

● Rules for Python variables:

● Variable name must start with a letter (preferred lower case) or the underscore character.

● Variable name cannot start with a number.

● A variable name can only contain alpha-numeric characters and underscores (A-z, 0-9, and _)

● Variable names are case-sensitive (name & Name & NAME are three different variables)

● Variable names must not have any space

- # Python Variable characteristic

  - The value stored in a variable can be changed during runtime execution.

  - All the operations done on the variable effects that there memory location.

- Can't use below list of symbol

- :'",<>/?|\()!@#$%^&*~-+`
